description

The TMS320VC33 DSP is a 32-bit, floating-point processor manufactured in 0.18-μm four-level-metal CMOS (TImeline) technology. The TMS320VC33 is part of the TMS320C3x generation of DSPs from Texas Instruments.

The TMS320C3x's internal busing and special digital-signal-processing instruction set have the speed and flexibility to execute up to 150 million floating-point operations per second (MFLOPS). The TMS320VC33 optimizes speed by implementing functions in hardware that other processors implement through software or microcode. This hardware-intensive approach provides performance previously unavailable on a single chip.

The TMS320VC33 can perform parallel multiply and ALU operations on integer or floating-point data in a single cycle. Each processor also possesses a general-purpose register file, a program cache, dedicated ARAUs, internal dual-access memories, one DMA channel supporting concurrent I/O, and a short machine-cycle time. High performance and ease of use are the results of these features.

TImeline is a trademark of Texas Instruments.
Other trademarks are the property of their respective owners.
† IEEE Standard 1149.1-1990 Standard-Test-Access Port

description (continued)

General-purpose applications are greatly enhanced by the large address space, multiprocessor interface, internally and externally generated wait states, one external interface port, two timers, one serial port, and multiple-interrupt structure. The TMS320C3x supports a wide variety of system applications from host processor to dedicated coprocessor. High-level-language support is easily implemented through a register-based architecture, large address space, powerful addressing modes, flexible instruction set, and well-supported floating-point arithmetic.

The TMS320VC33 is a superset of the TMS320C31. Designers now have an additional 1M bits of on-chip SRAM, a maximum throughput of 150 MFLOPS, and several I/O enhancements that allow easy upgrades to current systems or creation of new baselines. This data sheet provides information required to fully utilize the new features of the TMS320VC33 device. For general TMS320C3x architecture and programming information, see the *TMS320C3x User's Guide* (literature number SPRU031).

Terminal Functions

TERMINAL NAME	QTY	TYPE†	DESCRIPTION	CONDITIONS WHEN SIGNAL IS Z TYPE‡		
PRIMARY-BUS INTERFACE						
D31−D0	32	I/O/Z	32-bit data port	S	H	R
			Data port bus keepers (See Figure 9)	S		
A23−A0	24	O/Z	24-bit address port	S	H	R
R/$\overline{W}$	1	O/Z	Read/write. R/$\overline{W}$ is high when a read is performed and low when a write is performed over the parallel interface.	S	H	R
$\overline{STRB}$	1	O/Z	Strobe. For all external-accesses	S	H	
$\overline{PAGE0}$ − $\overline{PAGE3}$	1	O/Z	Page strobes. Four decoded page strobes for external access.	S	H	R
$\overline{RDY}$	1	I	Ready. $\overline{RDY}$ indicates that the external device is prepared for a transaction completion.			
$\overline{HOLD}$	1	I	Hold. When $\overline{HOLD}$ is a logic low, any ongoing transaction is completed. A23−A0, D31−D0, $\overline{STRB}$, and R/$\overline{W}$ are placed in the high-impedance state and all transactions over the primary-bus interface are held until $\overline{HOLD}$ becomes a logic high or until the NOHOLD bit of the primary-bus-control register is set.			
$\overline{HOLDA}$	1	O/Z	Hold acknowledge. $\overline{HOLDA}$ is generated in response to a logic-low on $\overline{HOLD}$. $\overline{HOLDA}$ indicates that A23−A0, D31−D0, $\overline{STRB}$, and R/$\overline{W}$ are in the high-impedance state and that all transactions over the bus are held. $\overline{HOLDA}$ is high in response to a logic-high of $\overline{HOLD}$ or the NOHOLD bit of the primary-bus-control register is set.	S		
CONTROL SIGNALS						
$\overline{RESET}$	1	I	Reset. When $\overline{RESET}$ is a logic low, the device is in the reset condition. When $\overline{RESET}$ becomes a logic high, execution begins from the location specified by the reset vector.			
EDGEMODE	1	I	Edge mode. Enables interrupt edge mode detection.			
$\overline{INT3}$−$\overline{INT0}$	4	I	External interrupts			
$\overline{IACK}$	1	O/Z	Interrupt acknowledge. $\overline{IACK}$ is generated by the IACK instruction. $\overline{IACK}$ can be used to indicate when a section of code is being executed.	S		
MCBL/$\overline{MP}$	1	I	Microcomputer Bootloader/microprocessor mode-select			
$\overline{SHZ}$	1	I	Shutdown high impedance. When active, $\overline{SHZ}$ places all pins in the high-impedance state. $\overline{SHZ}$ can be used for board-level testing or to ensure that no dual-drive conditions occur. **CAUTION:** A low on $\overline{SHZ}$ corrupts the device memory and register contents. Reset the device with $\overline{SHZ}$ high to restore it to a known operating condition.			
XF1, XF0	2	I/O/Z	External flags. XF1 and XF0 are used as general-purpose I/Os or to support interlocked processor instruction.	S		R
SERIAL PORT 0 SIGNALS						
CLKR0	1	I/O/Z	Serial port 0 receive clock. CLKR0 is the serial shift clock for the serial port 0 receiver.	S		R
CLKX0	1	I/O/Z	Serial port 0 transmit clock. CLKX0 is the serial shift clock for the serial port 0 transmitter.	S		R
DR0	1	I/O/Z	Data-receive. Serial port 0 receives serial data on DR0.	S		R
DX0	1	I/O/Z	Data-transmit output. Serial port 0 transmits serial data on DX0.	S		R
FSR0	1	I/O/Z	Frame-synchronization pulse for receive. The FSR0 pulse initiates the data-receive process using DR0.	S		R
FSX0	1	I/O/Z	Frame-synchronization pulse for transmit. The FSX0 pulse initiates the data-transmit process using DX0.	S		R

† I = input, O = output, Z = high-impedance state
‡ S = $\overline{SHZ}$ active, H = $\overline{HOLD}$ active, R = $\overline{RESET}$ active
§ Recommended decoupling. Four 0.1 µF for CV_{DD} and eight 0.1 µF for DV_{DD}.

Figure 3. Peripheral Bus Memory-Mapped Registers

clock generator

The clock generator provides clocks to the VC33 device, and consists of an internal oscillator and a phase-locked loop circuit. The clock generator requires a reference clock input, which can be provided by using a crystal resonator with the internal oscillator, or from an external clock source. The PLL circuit generates the device clock by multiplying the reference clock frequency by a x5 scale factor, allowing use of a clock source with a lower frequency than that of the CPU. The PLL is an adaptive circuit that, once synchronized, locks onto and tracks an input clock signal.

PLL and clock oscillator control

The clock mode control pins are decoded into four operational modes as shown in Figure 4. These modes control clock divide ratios, oscillator, and PLL power (see Table 1).

When an external clock input or crystal is connected, the opposite unused input is simply grounded. An XOR gate then passes one of the two signal sources to the PLL stage. This allows the direct injection of a clock reference into EXTCLK, or 1−20 MHz crystals and ceramic resonators with the oscillator circuit. The two clock sources include:

- A crystal oscillator circuit, where a crystal or ceramic resonator is connected across the XOUT and XIN pins and EXTCLK is grounded.
- An external clock input, where an external clock source is directly connected to the EXTCLK pin, and XOUT is left unconnected and XIN is grounded.

When the PLL is initially started, it enters a transitional mode during which the PLL acquires lock with the input signal. Once the PLL is locked, it continues to track and maintain synchronization with the input signal. The PLL is a simple x5 reference multiplier with bypass and power control.

The clock divider, under CPU control, reduces the clock reference by 1 (MAXSPEED), 1/16 (LOPOWER), or clock stop (IDLE2). Wake-up from the IDLE2 state is accomplished by a $\overline{\text{RESET}}$ or interrupt pin logic-low state.

A divide-by-two TMS320C31 equivalent mode of operation is also provided. In this case, the clock output reference is further divided by two with clock synchronization being determined by the timing of $\overline{\text{RESET}}$ falling relative to the present H1/H3 state.

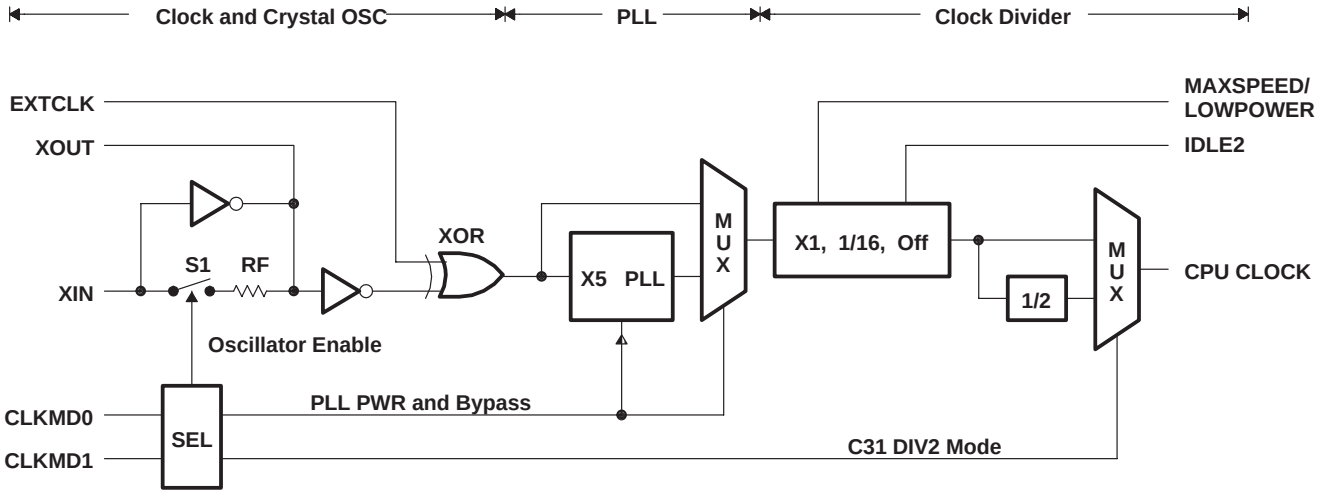

Figure 4. Clock Generation

Table 1. Clock Mode Select Pins

CLKMD0	CLKMD1	FEEDBACK	PLLPWR	RATIO	NOTES
0	0	Off	Off	1	Fully static, very low power
0	1	On	Off	1/2	Oscillator enabled
1	0	On	Off	1	Oscillator enabled
1	1	On	On	5	2 mA @ 60 MHz, 1.8 V PLL power. Oscillator enabled

PLL and clock oscillator control (continued)

Typical crystals in the 8−30 MHz range have a series resistance of 25 Ω, which increases below 8 MHz. To maintain proper filtering and phase relationships, R_d and Z_{out} of the oscillator circuit should be 10x−40x that of the crystal. A series compensation resistor (Rd), shown in Figure 5, is recommended when using lower frequency crystals. The XOUT output, the square wave inverse of XIN, is then filtered by the XOUT output impedance, C1 load capacitor, and R_d (if present). The crystal and C2 input load capacitor then refilters this signal, resulting in a XIN signal that is 75−85% of the oscillator supply voltage.

NOTE: Some ceramic resonators are available in a low-cost, three-terminal package that includes C1 and C2 internally. Typically, ceramic resonators do not provide the frequency accuracy of crystals.

NOTE: Better PLL stability can be achieved using the optional power supply isolation circuit shown in Figure 5. A similar filter can be used to isolate the $PLLV_{SS}$, as shown in Figure 6. $PLLV_{DD}$ can also be directly connected to CV_{DD}.

Table 2. Typical Crystal Circuit Loading

FREQUENCY (MHz)	Rd (Ω)	C1 (pF)	C2 (pF)	CL† (pF)	RL† (Ω)
2	4.7k	18	18	12	200
5	2.2k	18	18	12	60
10	470	15	15	12	30
15	0	15	12	12	25
20	0	9	9	10	25

† CL and RL are typical internal series load capacitance and resistance of the crystal.

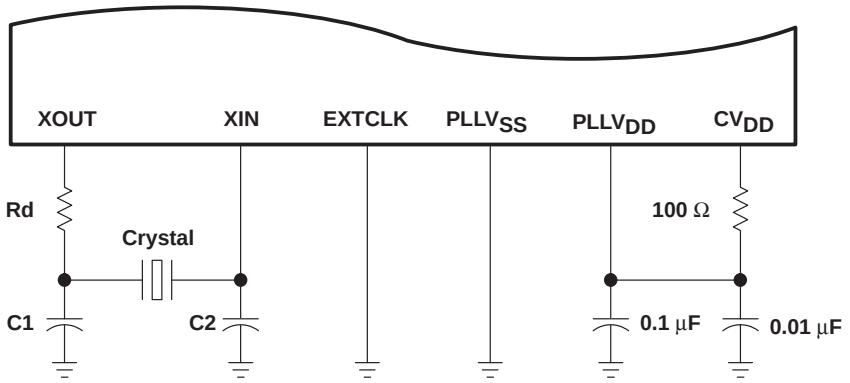

Figure 5. Self-Oscillation Mode

PLL isolation

The internal PLL supplies can be directly connected to CV_{DD} and V_{SS} (0 Ω case), partially isolated as shown in Figure 5, or fully isolated as shown in Figure 6. The RC network prevents the PLL supplies from turning high frequency noise in the CV_{DD} and V_{SS} supplies into jitter.

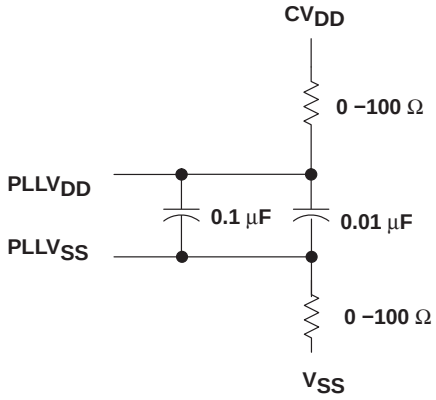

Figure 6. PLL Isolation Circuit Diagram

clock and PLL considerations on initialization

On power up, the CPU clock divide mode can be in MAXSPEED, LOPOWER or IDLE2, or the PLL could be in an undefined mode. $\overline{\text{RESET}}$ falling in the presence of a valid CPU clock is used to clear this state, after which the device will synchronously terminate any external activity.

The 5x Fclkin PLL of the TMS320VC33 contains an 8-bit PLL−LOCK counter which causes the PLL to output a frequency of Fclkin/2 during the initial ramp. This counter, however, does not increment while $\overline{\text{RESET}}$ is low or in the absence of an input clock. A minimum of 256 input clocks are required before the first falling edge of reset for the PLL to output to clear this counter. The setup and behavior that is seen is as follows.

Power is applied to the DSP with $\overline{\text{RESET}}$ low and the input clock high or low. A clock is applied ($\overline{\text{RESET}}$ is still low) and the PLL appears to lock on to the input clock, producing the expected x5 output frequency. $\overline{\text{RESET}}$ is driven high and the PLL output immediately drops to Fclkin/2 for 0-256 input cycles or 128 of the Fclkin/2 output cycles. The PLL/CPU clock then switches to x5 mode.

The switch over is synchronous and does not create a clock glitch, so the only effect is that the CPU runs slow for up to the first 128 cycles after reset goes high. Once the PLL has stabilized, the counter will remain cleared and subsequent resets will not exhibit this condition.

Systems that are not using the crystal oscillator may be required to supply a current of 250mA per DSP if full power is applied with no clock source. This extra current condition is a result of uninitialized internal logic within the DSP core and is corrected when the CPU sees a minimum of four internal clocks. The crystal oscillator is typically immune to this condition since the oscilator and core circuitry become semi-functional at CV_{DD} = 1 V where the fault current is considerably lower. An alternate clock pulse can also be applied to either the EXTCLK or XIN clock input pins.

power sequencing considerations

Though an internal ESD and CMOS latchup protection diode exists between CV_{DD} and DV_{DD}, it should not be considered a current-carrying device on power up. An external Schottky diode should be used to prevent CV_{DD} from exceeding DV_{DD} by more than 0.7 V. The effect of this diode during power up is that if CV_{DD} is powered up first, DV_{DD} follows by one diode drop even when the DV_{DD} supply is not active.

Typical systems using LDOs of the same family type for both DV_{DD} and CV_{DD} will track each other during power up. In most cases, this is acceptable; but if a high-impedance pin state is required on power up, the $\overline{SHZ}$ pin can be used to asynchronously disable all outputs. $\overline{RESET}$ should not be used in this case since some signals require an active clock for $\overline{RESET}$ to have an effect and the clock may not yet be active. The internal core logic becomes functional at approximately 0.8 V while the external pin IO becomes active at about 1.5 V.

EDGEMODE

When EDGEMODE = 1, a sampled digital delay line is decoded to generate a pulse on the falling edge of the interrupt pin. To ensure interrupt recognition, input signal logic-high and logic-low states must be held longer than the synchronizer delay of one CPU clock cycle. Holding these inputs to no less than two cycles in both the logic-low and logic-high states is sufficient.

When EDGEMODE = 0, a logic-low interrupt pin continually sets the corresponding interrupt flag. The CPU or DMA can clear this flag within two cycles of it being set. This is the maximum interrupt width that can be applied if only one interrupt is to be recognized. The CPU can manually clear IF bits within an interrupt service routine (ISR), effectively lengthening the maximum ISR width.

After reset, EDGEMODE is temporarily disabled, allowing logic-low INT pins to be detected for bootload operation.

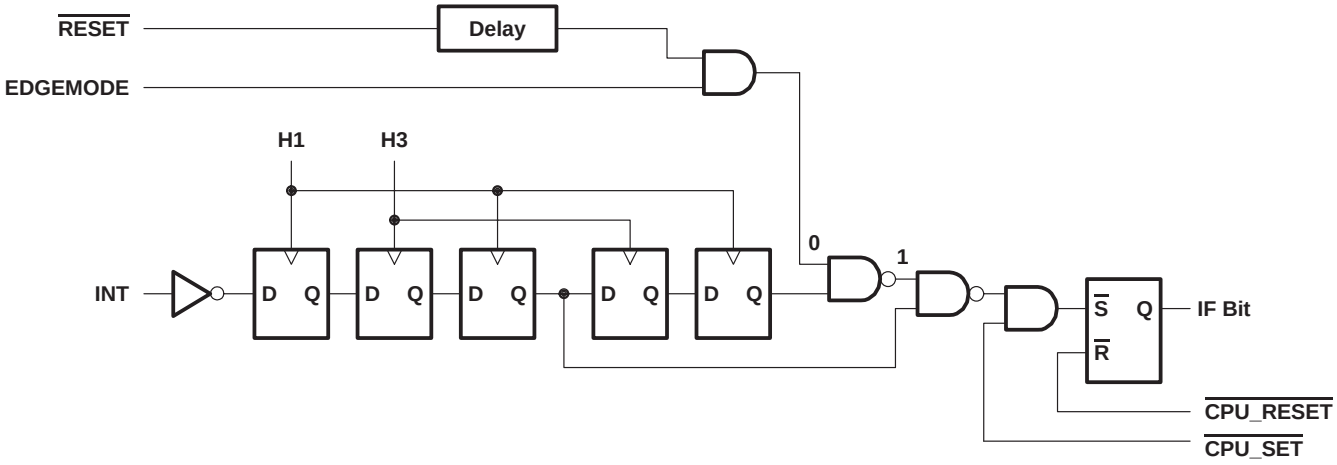

Figure 7. EDGEMODE and Interrupt Flag CIrcuit

reset operation

When $\overline{RESET}$ is applied, the CPU attempts to safely exit any pending read or write operations that may be in progress. This can take as much as 10 CPU cycles, after which, the address, data, and control pins will be in an inactive or high-impedance state.

When both $\overline{RESET}$ and $\overline{SHZ}$ are applied, the device immediately enters the reset state with the pins held in high-impedance mode. $\overline{SHZ}$ should then be disabled at least 10 CPU cycles before $\overline{RESET}$ is set high. $\overline{SHZ}$ can be used during power-up sequencing to prevent undefined address, data, and control pins, avoiding system conflicts.

$\overline{\text{PAGE0}}$ − $\overline{\text{PAGE3}}$ select lines

To facilitate simpler and higher speed connection to external devices, the TMS320VC33 includes four predecoded select pins that have the same timings as $\overline{\text{STRB}}$. These pins are decoded from A22, A23, and $\overline{\text{STRB}}$ and are active only during external accesses over the ranges shown in Table 3. All external bus accesses are controlled by a single bus control register.

Table 3. $\overline{\text{PAGE0}}$ − $\overline{\text{PAGE3}}$ Ranges

	START	END
$\overline{\text{PAGE0}}$	0x000000	0x3FFFFF
$\overline{\text{PAGE1}}$	0x400000	0x7FFFFF
$\overline{\text{PAGE2}}$	0x800000	0xBFFFFF
$\overline{\text{PAGE3}}$	0xC00000	0xFFFFFF

using external logic with the $\overline{\text{READY}}$ pin

The key to designing external wait-state logic is the internal bus control register and associated internal logic that logically combines the external $\overline{\text{READY}}$ pin with the much faster on-chip bus control logic. This essentially allows slow external logic to interact with the bus while easily meeting the $\overline{\text{READY}}$ input timings. It is also relevant to mention that the combined ready signals are sampled on the rising edge of the internal H1 clock. Please refer to Figure 8 for the following examples.

example 1

A simple 0 or WTCNT wait-state decoder can be created by simply tying an address line back to the $\overline{\text{READY}}$ pin and selecting the AND option. When the tied back address is low, the bus runs with 0 wait states. When the tied back address is high, the bus will be controlled by the internal wait-state counter.

By enabling the bank compare logic, proper operation is further ensured by inserting a null cycle before a read on the next bank is performed (writes are not pre-extended). This extra time can also be used by external logic to affect the feedback path.

example 2

An N−WTCNT minimum wait-state decoder can also be created by tying back an address line to $\overline{\text{READY}}$ and logically ORing it with the internal bank compare and wait count signals. When the address pin is low, bus timing is determined by the internal WTCNT and BNKCMP settings. When the address line is high, the bus can run no faster than the WTCNT counter and is extended as long as $\overline{\text{READY}}$ is held high.

example 2 (continued)

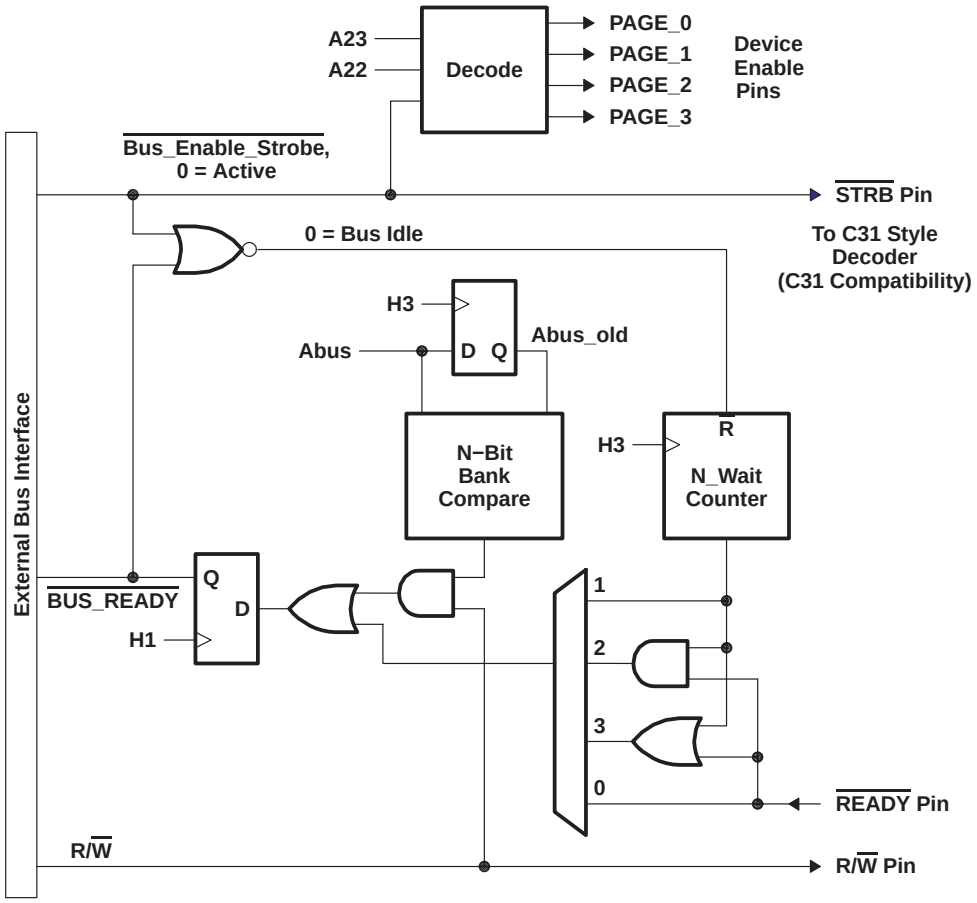

Figure 8. Internal Ready Logic, Simplified Diagram

example 2 (continued)

Table 4. MUX Select (Bus Control Register Bits 4 and 3)

BIT 4	BIT 3	RESULTS
0	0	Ignore internal wait counter and use only external $\overline{\text{READY}}$
0	1	Use only internal wait counter and ignore ready pin
1	0	Logically AND internal wait counter with ready pin
1	1	Logically OR internal wait counter with ready pin (reset default)

posted writes

External writes are effectively “posted” to the bus, which then acts like an output latch until the write completes. Therefore, if the application code is executing internally, it can perform a very slow external write with no penalty since the bus acts like it has a one-level-deep write FIFO.

data bus I/O buffer

The circuit shown in Figure 9 is incorporated into each data pin to lightly “hold” the last driven value on the data bus pins when the DSP or an external device is not actively driving the bus. Each bus keeper is built from a three-state driver with nominal 15 kΩ output resistance which is fed back to the input in a positive feedback configuration. The resistance isolated driver then pulls the output in one direction or the other keeping the last driven value. This circuit is enabled in all functional modes and is only disabled when $\overline{\text{SHZ}}$ is pulled low.

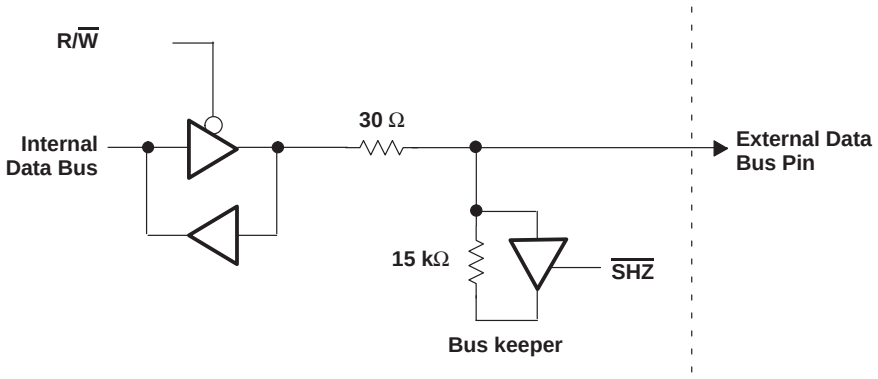

Figure 9. Bus Keeper Circuit

For an external device to change the state of these pins, it must be able to drive a small DC current until the driver threshold is crossed. At the crossover point, the driver changes state, agreeing with the external driver and assisting the change. The voltage threshold of the bus keeper is approximately at 50% of the DV_{DD} supply voltage. The typical output impedance of 30 Ω for all TMS320VC33 I/O pins is easily capable of meeting this requirement.

bootloader operation

When MCBL/$\overline{\text{MP}}$ = 1, an internal ROM is decoded into the address range of 0x000000−0x000FFF. Therefore, when reset occurs, execution begins within the internal ROM program and vector space. No external activity will be evident until one of the boot options is enabled. These options are enabled by pulling an external interrupt pin low, which the boot-load software then detects, causing a particular routine to be executed (see Table 5).

bootloader operation (continued)

Table 5. $\overline{INT0}$ − $\overline{INT3}$ Sources

ACTIVE INTERRUPT	ADDRESS/SOURCE WHERE BOOT DATA IS READ FROM	DATA FORMAT
$\overline{INT0}$	0x001000	8, 16, or 32-bit width
$\overline{INT1}$	0x400000	8, 16, or 32-bit width
$\overline{INT2}$	0xFFF000	8, 16, or 32-bit width
$\overline{INT3}$	Serial Port	32-bit, external clock, and frame synch

When MCBL/$\overline{MP}$ = 1, the reset and interrupt vectors are hard-coded within the internal ROM. Since this is a read-only device, these vectors cannot be modified. To enable user-defined interrupt routines, the internal vectors contain fixed values that point to an internal section of SRAM beginning at 0x809FC1. Code execution begins at these locations so it is important to place branch instructions (to the interrupt routine) at these locations and not vectors.

The bootloader program requires a small stack space for calls and returns. Two SRAM locations at 0x809800 and 0x809801 are used for this stack. Data should not be boot loaded into these locations as this will corrupt the bootloader program run-time stack. After the boot-load operation is complete, a program can reclaim these locations. The simplest solution is to begin a program's stack or uninitialized data section at 0x809800.

For additional detail on bootloader operation including the bootloader source code, see the *TMS320C3x User's Guide* (literature number SPRU031).

A bit I/O line or external logic can be used to safely disable the MCBL mode after bootloading is complete. However, to ensure proper operation, the CPU should not be currently executing code or using external data as the change takes place. In the following example, the XF0 pin is 3-state on reset, which allows the pullup resistor to place the DSP in MCBL mode. The following code, placed at the beginning of an application then causes the XF0 pin to become an active-logic-low output, changing the DSP mode to MP. The cache-enable and RPTS instructions are used since they cause the LDI instruction to be executed multiple times even though it has been fetched only once (before the mode change). In other words, the RPTS instruction acts as a one-level-deep program cache for externally executed code. If the application code is to be executed from internal RAM, no special provisions are needed.

```
LDI    8000h,ST  ; Enable the cache
RPTS   4         ; RPTS fetchs the following opcode 1 time
LDI    2h, IOF   ; Drive MCBL/MP=0 for several cycles allowing
                 ; the pipeline to clear
```

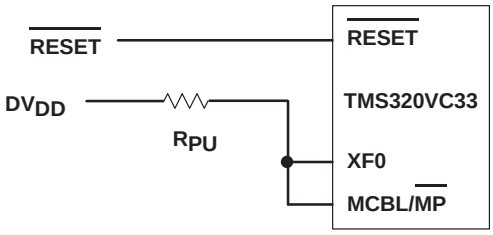

Figure 10. Changing Bootload Select Pin

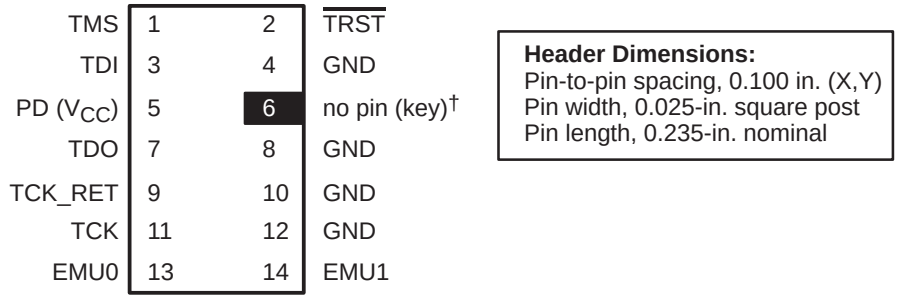
JTAG emulation

Though the TMS320VC33 contains a JTAG debug port which allows multiple JTAG enabled chips to be daisy-chained, boundary scan of the pins is not supported. If the pin scan path is selected, it will be routed through a null register with a length of one. For additional information concerning the emulation interface, see *JTAG/MPSD Emulation Technical Reference* (literature number SPDU079).

designing your target system's emulator connector (14-pin header)

JTAG target devices support emulation through a dedicated emulation port. This port is a superset of the IEEE 1149.1 standard and is accessed by the emulator. To communicate with the emulator, **your target system must have a 14-pin header** (two rows of seven pins) with the connections that are shown in Figure 11. Table 6 describes the emulation signals.



† While the corresponding female position on the cable connector is plugged to prevent improper connection, the cable lead for pin 6 is present in the cable and is grounded, as shown in the schematics and wiring diagrams in this document.

Figure 11. 14-Pin Header Signals and Header Dimensions

Table 6. 14-Pin Header Signal Descriptions

SIGNAL	DESCRIPTION	EMULATOR† STATE	TARGET† STATE
TMS‡	Test mode select	O	I
TDI	Test data input	O	I
TDO	Test data output	I	O
TCK	Test clock. TCK is a 10.368-MHz clock source from the emulation cable pod. This signal can be used to drive the system test clock	O	I
$\overline{\text{TRST}}$‡	Test reset	O	I
EMU0§¶	Emulation pin 0	I	I/O
EMU1§¶	Emulation pin 1	I	I/O
PD(V_{CC})	Presence detect. Indicates that the emulation cable is connected and that the target is powered up. PD should be tied to V_{CC} in the target system.	I	O
TCK_RET	Test clock return. Test clock input to the emulator. May be a buffered or unbuffered version of TCK.	I	O
GND	Ground		

† I = input; O = output

‡ Use 1−50K pulldown for TRST. Do not use pullup resistors on $\overline{\text{TRST}}$; it has an internal pulldown device. In a low-noise environment, $\overline{\text{TRST}}$ can be left floating. In a high-noise environment, an additional pulldown resistor may be needed. (The size of this resistor should be based on electrical current considerations.)

§ Use 1−50K pullups for TMS, EMU0 and EMU1.

¶ EMU0 and EMU1 are I/O drivers configured as open-drain (open-collector) drivers. They are used as bidirectional signals for emulation global start and stop.

designing your target system's emulator connector (14-pin header) (continued)

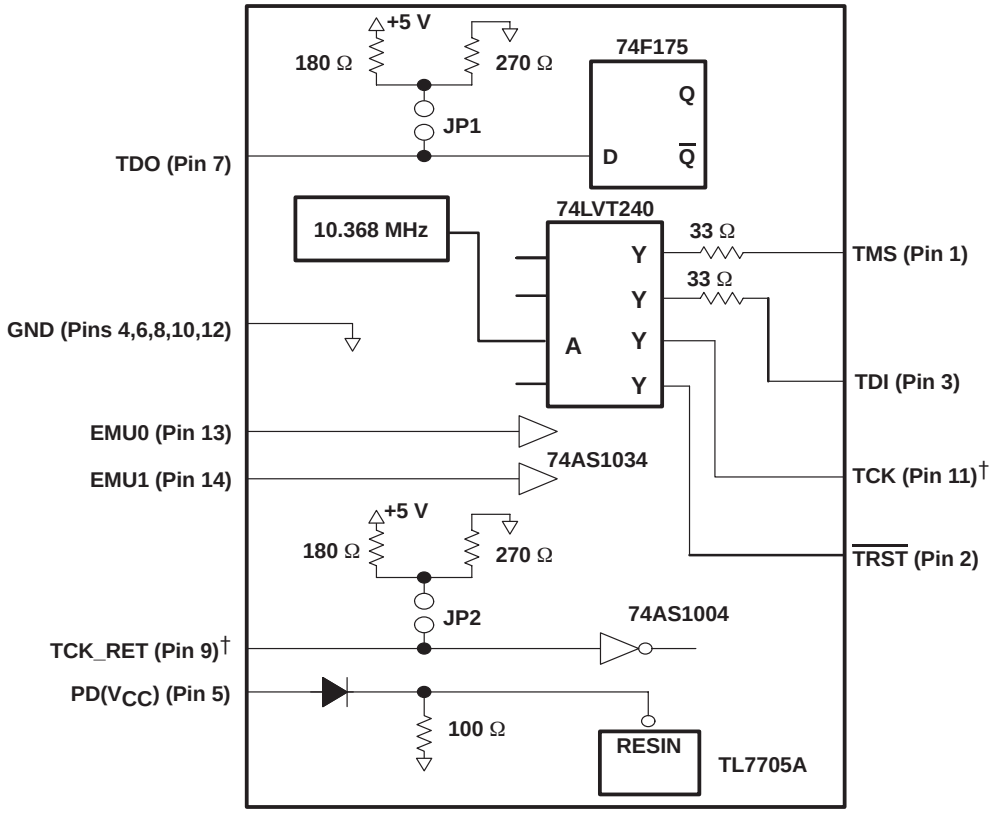
Although you can use other headers, recommended parts include:

straight header, unshrouded	DuPont Connector Systems part numbers:	65610−114
		65611−114
		67996−114
		67997−114

JTAG emulator cable pod logic

Figure 12 shows a portion of the emulator cable pod. The functional features of the pod are as follows:

- Signals TDO and TCK_RET can be parallel-terminated inside the pod if required by the application. By default, these signals are not terminated.
- Signal TCK is driven with a 74LVT240 device. Because of the high-current drive (32 mA I_{OL}/I_{OH}), this signal can be parallel-terminated. If TCK is tied to TCK_RET, the parallel terminator in the pod can be used.
- Signals TMS and TDI can be generated from the falling edge of TCK_RET, according to the IEEE 1149.1 bus slave device timing rules.
- Signals TMS and TDI are series-terminated to reduce signal reflections.
- A 10.368-MHz test clock source is provided. You may also provide your own test clock for greater flexibility.



† The emulator pod uses TCK_RET as its clock source for internal synchronization. TCK is provided as an optional target system test clock source.

Figure 12. JTAG Emulator Cable Pod Interface

symbolization and speed ratings

The device revision can be determined by the lot trace code marked on the top of the package. The location for the lot trace codes for the PGE package is shown in Figure 13.

TMS320VC33 devices are rated in peak MFLOPS, shown as a suffix to the orderable part number (see Table 8). Figure 13 shows the device symbolization on the PGE package. A general “TMS320VC33” symbol defaults to the lowest speed rating for that device (120 MFLOPS). 150-MFLOPS devices are denoted with a “150” mark on the upper right-hand corner of the package. The VC33 CPU instruction rate is MFLOPS/2.

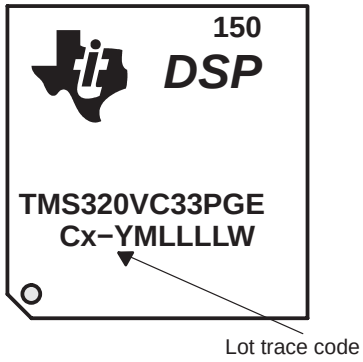


Figure 13. PGE Package (Top View)

Table 7. Example, Typical Lot Trace Code for TMS320VC33 DSP (PGE)

Lot Trace Code	Silicon Revision	Comments
Blank (No letter in prefix)	1.0	TMX320VC33
A (Letter in prefix is A)	1.1	TMS320VC33
B (Letter in prefix is B)	1.2	TMS320VC33
C (Letter in prefix is C)	1.3	TMS320VC33

Table 8. Device Orderable Part Numbers

DEVICE	SPEED (MFLOPS)	TEMPERATURE RATING
TMS320VC33PGE120	120	0°C to 90°C
TMS320VC33PGEA120	120	− 40°C to 100°C
TMS320VC33PGE150	150	0°C to 90°C

device and development support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP family devices and support tools. Each TMS320™ DSP member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS). This development flow is defined below.

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

TMS Fully-qualified production device

Support tool development evolutionary flow:

TMDX Development support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development support product

TMX and TMP devices and TMDX development support tools are shipped against the following disclaimer:

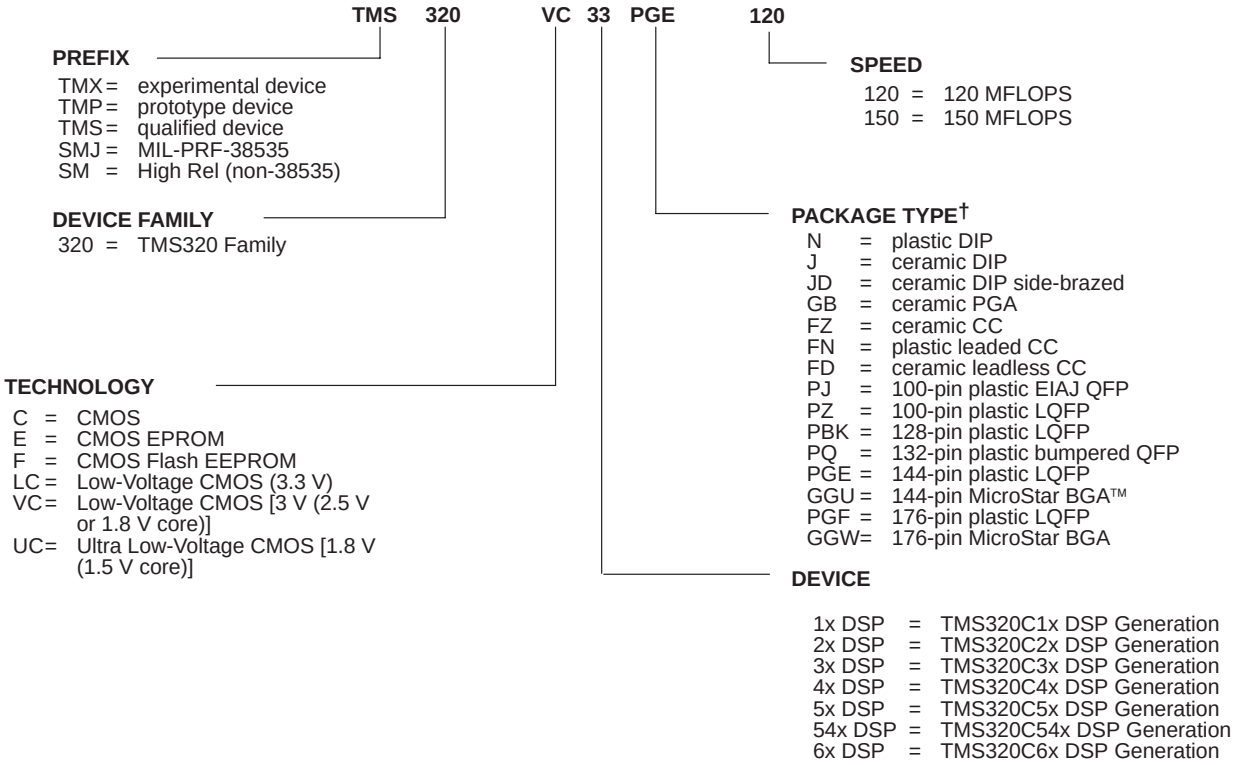
"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development support tools have been characterized fully, and the quality and reliability of the device has been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PZ, PGE, PBK, or GGU) and temperature range (for example, L). Figure 14 provides a legend for reading the complete device name for any TMS320™ DSP family member.

device and development support tool nomenclature (continued)



† DIP = Dual-In-Line Package
PGA = Pin Grid Array
CC = Chip Carrier
QFP = Quad Flat Package
LQFP = Low-Profile Quad Flat Package
BGA = Ball Grid Array

Figure 14. TMS320™ DSP Device Nomenclature

absolute maximum ratings over specified temperature range (unless otherwise noted)†

Supply voltage range, DV_{DD}‡ . . . . . −0.3 V to 4 V
Supply voltage range, CV_{DD}‡ . . . . . −0.3 V to 2.4 V
Input voltage range, V_I§ . . . . . −1 V to 4.6 V
Output voltage range, V_O . . . . . −0.3 V to 4.6 V
Continuous power dissipation (worst case)¶ . . . . . 500 mW
(for TMS320VC33-150)
Operating case temperature range, T_C (PGE − commercial) . . . . . 0°C to 90°C
T_C (PGEA − industrial) . . . . . − 40°C to 100°C
Storage temperature range, T_{stg} . . . . . − 55°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
‡ All voltage values are with respect to V_{SS}.
§ Absolute DC input level should not exceed the DV_{DD} or V_{SS} supply rails by more than 0.3 V. An instantaneous low current pulse of < 2 ns, < 10 mA, and < 1 V amplitude is permissible.
¶ Actual operating power is much lower. This value was obtained under specially produced worst-case test conditions for the TMS320VC33, which are not sustained during normal device operation. These conditions consist of continuous parallel writes of a checkerboard pattern to the external data and address buses at the maximum possible rate with a capacitive load of 30 pF. See normal (I_{CC}) current specification in the electrical characteristics table and also read *TMS320C3x General-Purpose Applications User’s Guide* (literature number SPRU194).

recommended operating conditions‡#‖

		MIN	NOM	MAX	UNIT
CV_{DD}	Supply voltage for the core CPU☆	1.71	1.8	1.89	V
DV_{DD}	Supply voltage for the I/O pins□	3	3.3	3.6	V

PARAMETER MEASUREMENT INFORMATION

timing parameter symbology

Timing parameter symbols used herein were created in accordance with JEDEC Standard 100. In order to shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows, unless otherwise noted:

Lowercase subscripts and their meanings	
a	access time
c	cycle time (period)
d	delay time
dis	disable time
en	enable time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)
x	unknown, changing, or don't care level

Letters and symbols and their meanings	
H	High
L	Low
V	Valid
Z	High Impedance

Additional symbols and their meaning			
A	Address lines (A23−A0)	H	H1 and H3
ASYNCH	Asynchronous reset signals (XF0, XF1, CLKX0, DX0, FSX0, CLKR0, DR0, FSR0, TCLK0, and TCLK1)	HOLD	$\overline{\text{HOLD}}$
CLKX	CLKX0	HOLDA	$\overline{\text{HOLDA}}$
CLKR	CLKR0	IACK	$\overline{\text{IACK}}$
CONTROL	Control signals	INT	$\overline{\text{INT3}}$−$\overline{\text{INT0}}$
D	Data lines (D31−D0)	PAGE	$\overline{\text{PAGE0}}$−$\overline{\text{PAGE3}}$
DR	DR	RDY	$\overline{\text{RDY}}$
DX	DX	RW	R/$\overline{\text{W}}$
EXTCLK	EXTCLK	RW	R/$\overline{\text{W}}$
FS	FSX/R	RESET	$\overline{\text{RESET}}$
FSX	FSX0	S	$\overline{\text{STRB}}$
FSR	FSR0	SCK	CLKX/R
GPI	General-purpose input	SHZ	$\overline{\text{SHZ}}$
GPIO	General-purpose input/output; peripheral pin (CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, TCLK0, and TCLK1)	TCLK	TCLK0, TCLK1, or TCLKx
GPO	General-purpose output	XF	XF0, XF1, or XFx
H1	H1	XF0	XF0
H3	H3	XF1	XF1
		XIN	XIN

phase-locked loop (PLL) circuit timing

switching characteristics over recommended operating conditions for phase-locked loop using EXTCLK or on-chip crystal oscillator†

PARAMETER		MIN	MAX	UNIT
F_{pllin}	Frequency range, PLL input	5	15	MHz
F_{pllout}	Frequency range, PLL output	25	75	MHz
I_{pll}	PLL current, CV_{DD} supply		2	mA
P_{pll}	PLL power, CV_{DD} supply		5	mW
PLL_{dc}	PLL output duty cycle at H1	45	55	%
PLLJ	PLL output jitter, F_{pllout} = 25 MHz		400	ps
PLL_{LOCK}	PLL lock time in input cycles		1000	cycles

† Duty cycle is defined as $100*t_1/(t_1+t_2)\%$

To ensure clean internal clock references, the minimal low and high pulse durations must be maintained. At high frequencies, this may require a fast rise and fall time as well as a tightly controlled duty cycle. At lower frequencies, these requirements are less restrictive when in x1 and x0.5 modes. The PLL, however, must have an input duty cycle of between 40% and 60% for proper operation.

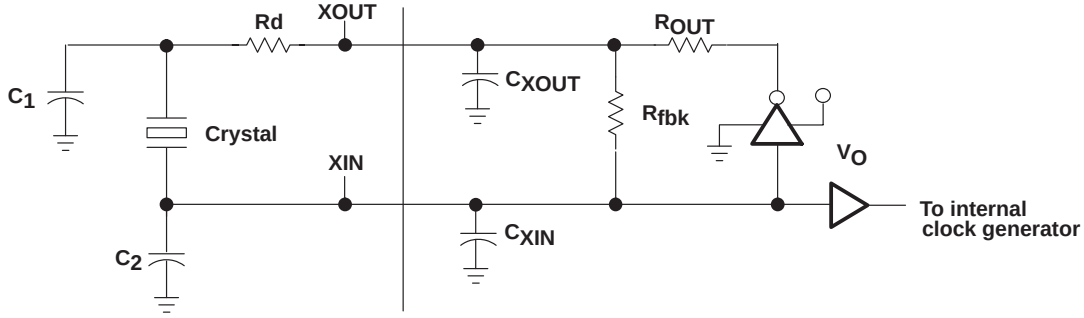
clock circuit timing

The following table defines the timing parameters for the clock circuit signals.

switching characteristics over recommended operating conditions for on-chip crystal oscillator† (see Figure 16)

PARAMETER		MIN	TYP	MAX	UNIT
V_O	Oscillator internal supply voltage		CV_{DD}		V
F_O	Fundamental mode frequency range	1		20	MHz
V_{bias}	DC bias point (input threshold)	40	50	60	$\%V_O$
R_{fbk}	Feedback resistance	100	300	500	kΩ
R_{out}	Small signal AC output impedance	250	500	1000	Ω
V_{xoutac}	AC output voltage with test crystal‡		85		$\%V_O$
V_{xinac}	AC input voltage with test crystal‡		85		$\%V_O$
V_{xoutl}	$V_{xin} = V_{xinh}$, $I_{xout} = 0$, F_O=0 (logic input)	V_{SS} − 0.1		V_{SS} + 0.3	V
V_{xouth}	$V_{xin} = V_{xinl}$, $I_{xout} = 0$, F_O=0 (logic input)	CV_{DD} − 0.3		CV_{DD} + 0.1	V
V_{inl}	When used for logic level input, oscillator enabled	−0.3		0.2 * V_O	V
V_{inh}	When used for logic level input, oscillator enabled	0.8 * V_O		DV_{DD} + 0.3	V
V_{xinh}	When used for logic level input, oscillator disabled	0.7 * DV_{DD}		DV_{DD} + 0.3	V
C_{xout}	XOUT internal load capacitance	2	3	5	pF
C_{xin}	XIN internal load capacitance	2	3	5	pF
$t_{d(XIN-H1)}$	Delay time, XIN to H1 x1 and x0.5 modes	2	5.5	8	ns
I_{inl}	Input current, feedback enabled, V_{il} = 0			50	µA
I_{inh}	Input current, feedback enabled, $V_{il} = V_{ih}$			−50	µA

† This circuit is intended for series resonant fundamental mode operation.
‡ Signal amplitude is dependent on the crystal and load used.



NOTE A: See Table 2 for value of Rd.

Figure 16. On-Chip Oscillator Circuit

clock circuit timing (continued)

The following tables define the timing requirements and switching characteristics for EXTCLK.

timing requirements for EXTCLK, all modes (see Figure 17 and Figure 18)

			MIN	MAX	UNIT
$t_{r(EXTCLK)}$	Rise time, EXTCLK	F = F_{max}, x0.5 and x1 modes		1	ns
		F < F_{max}		4	
$t_{f(EXTCLK)}$	Fall time, EXTCLK	F = F_{max}, x0.5 and x1 modes		1	ns
		F < F_{max}		4	
$t_{w(EXTCLKL)}$	Pulse duration, EXTCLK low	x5 mode	21		ns
		x1 mode	5.5		
		x0.5 mode	4.0		
$t_{w(EXTCLKH)}$	Pulse duration, EXTCLK high	x5 mode	21		ns
		x1 mode	5.5		
		x0.5 mode	4.0		
$t_{dc(EXTCLK)}$	Duty cycle, EXTCLK [$t_{w(EXTCLKH)}$ / $t_{c(H)}$]	x5 PLL mode	40	60	%
		x1 and x0.5 modes, F = max	45	55	
		x1 and x0.5 modes, F = 0 Hz	0	100	
$t_{c(EXTCLK)}$	Cycle time, EXTCLK, VC33-120	x5 mode	83.3	200	ns
		x1 mode	16.7		
		x0.5 mode	10		
	Cycle time, EXTCLK, VC33-150	x5 mode	66.7	200	
		x1 mode	13.3

memory read/write timing

The following tables define memory read/write timing parameters for $\overline{\text{STRB}}$.

timing requirements for memory read/write† (see Figure 19, Figure 20, and Figure 21)

			VC33-120		VC33-150		UNIT
			MIN	MAX	MIN	MAX	
$t_{su(D-H1L)R}$	Setup time, Data before H1 low (read)		5		5		ns
$t_{h(H1L-D)R}$	Hold time, Data after H1 low (read)		−1		−1		ns
$t_{su(RDY-H1H)}$	Setup time, $\overline{\text{RDY}}$ before H1 high		5		4		ns
$t_{h(H1H-RDY)}$	Hold time, $\overline{\text{RDY}}$ after H1 high		−1		−1		ns
$t_{d(A-RDY)}$	Delay time, Address valid to $\overline{\text{RDY}}$			P−7‡		P−6‡	ns
$t_{v(A-D)}$	Valid time, Data valid after address PAGEx, or STRB valid	0 wait state, C_L = 30 pF		9		6	ns
		1 wait state		$t_{c(H)}$+9		$t_{c(H)}$+6	ns

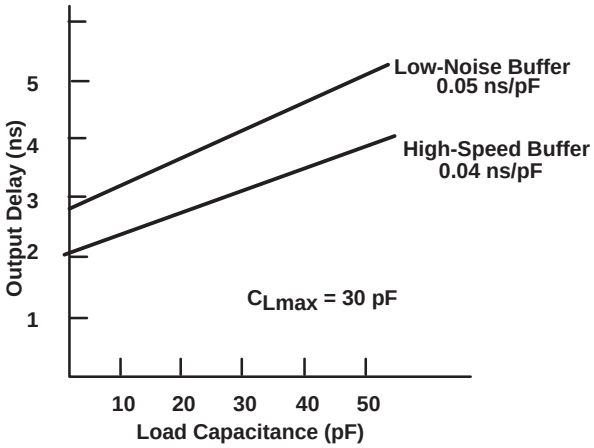
† These timings assume a similar loading of 30 pF on all pins.
‡ P = $t_{c(H)}$/2 (when duty cycle equals 50%).

switching characteristics over recommended operating conditions for memory read/write† (see Figure 19, Figure 20, and Figure 21)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{d(H1L-SL)}$	Delay time, H1 low to $\overline{\text{STRB}}$ low	−1	4	−1	3	ns
$t_{d(H1L-SH)}$	Delay time, H1 low to $\overline{\text{STRB}}$ high	−1	4	−1	3	ns
$t_{d(H1H-RWL)W}$	Delay time, H1 high to R/$\overline{\text{W}}$ low (write)	−1	4	−1	3	ns
$t_{d(H1L-A)}$	Delay time, H1 low to address valid	−1	4	−1	3	ns
$t_{d(H1H-RWH)W}$	Delay time, H1 high to R/$\overline{\text{W}}$ high (write)	−1	4	−1	3	ns
$t_{d(H1H-A)W}$	Delay time, H1 high to address valid on back-to-back write cycles (write)	−1	4	−1	3	ns
$t_{v(H1L-D)W}$	Valid time, Data after H1 low (write)		6		5	ns
$t_{h(H1H-D)W}$	Hold time, Data after H1 high (write)	0	5	0	5	ns

† These timings assume a similar loading of 30 pF on all pins.

Output load characteristics for high-speed and low-speed (low-noise) output buffers are shown in Figure 19. High-speed buffers are used on A0 − A23, $\overline{\text{PAGE0}}$ − $\overline{\text{PAGE3}}$, H1, H3, $\overline{\text{STRB}}$, and R/$\overline{\text{W}}$. All other outputs use the low-speed, (low-noise) output buffer.



LOAD	HIGH SPEED	LOW NOISE
0 pF	2.0	2.8
15 pF	2.6	3.4
30 pF	3.2	4.4
50 pF	4.0	5.25

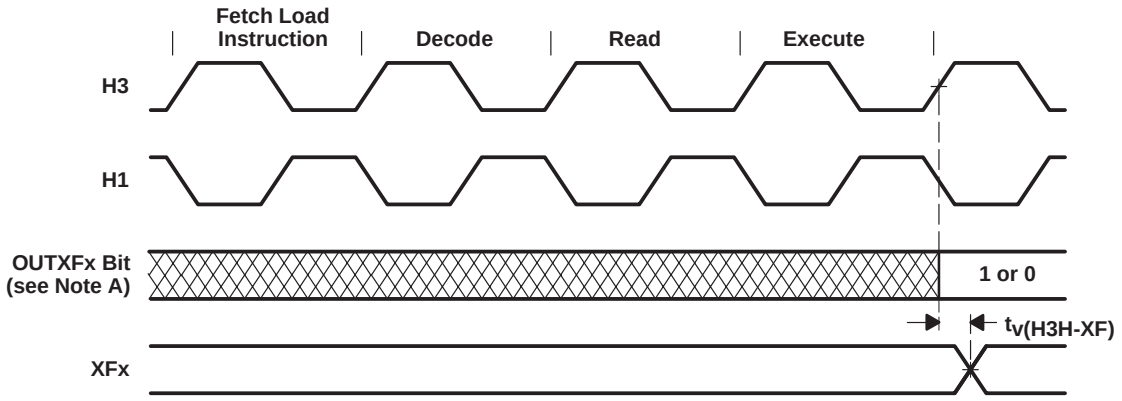
loading when XF is configured as an output

The following table defines the timing parameter for loading the XF register when the XFx pin is configured as an output.

switching characteristics over recommended operating conditions for loading the XF register when configured as an output pin (see Figure 25)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{v(H3H-XF)}$	Valid time, XFx after H3 high		4		3	ns



NOTE A: OUTXFx represents either bit 2 or 6 of the IOF register.

Figure 25. Timing for Loading XF Register When Configured as an Output Pin

changing XFx from an output to an input

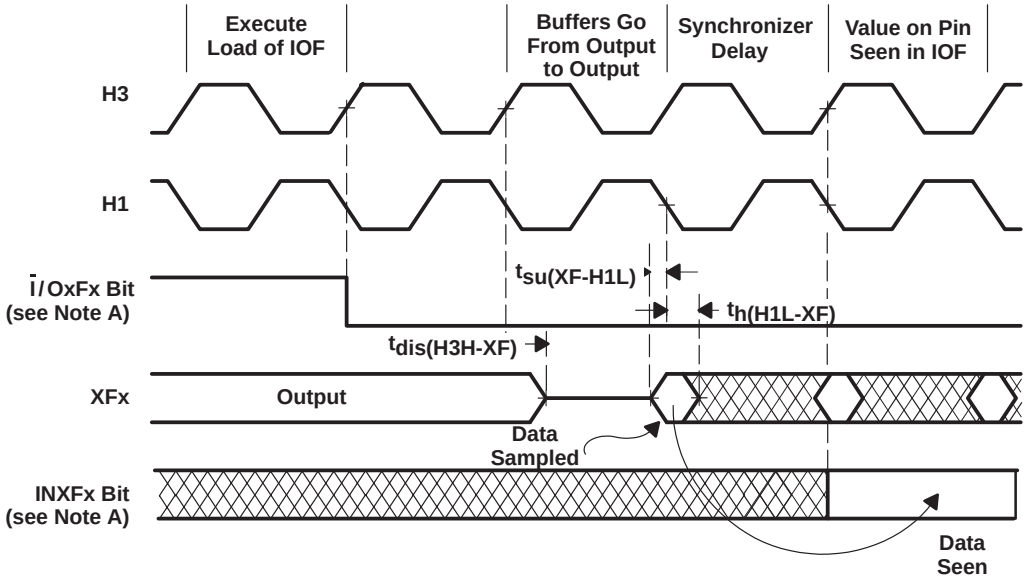
The following tables define the timing parameters for changing the XFx pin from an output pin to an input pin.

timing requirements for changing XFx from output to input mode (see Figure 26)

		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(XF-H1L)}$	Setup time, XFx before H1 low	5		4		ns
$t_{h(H1L-XF)}$	Hold time, XFx after H1 low	0		0		ns

switching characteristics over recommended operating conditions for changing XFx from output to input mode (see Figure 26)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{dis(H3H-XF)}$	Disable time, XFx after H3 high		6		5	ns



NOTE A: I/OxFx represents either bit 1 or bit 5 of the IOF register, and INXFx represents either bit 3 or bit 7 of the IOF register.

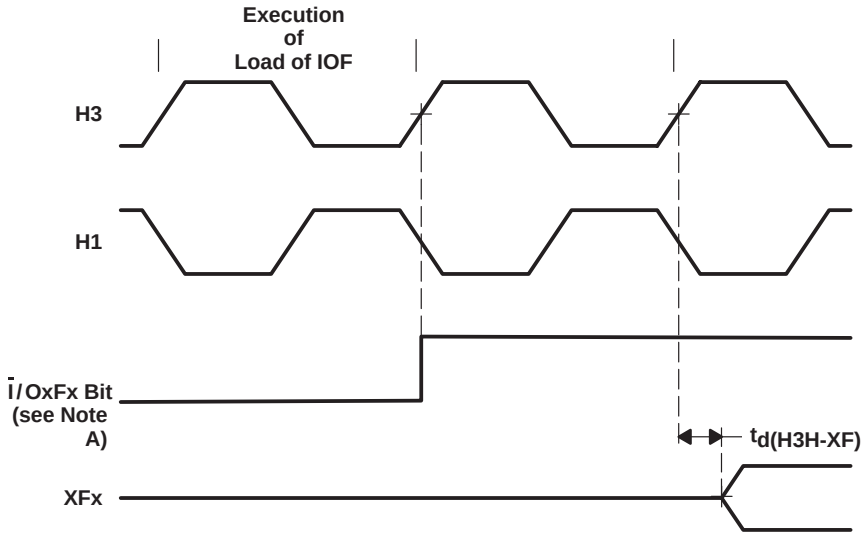
Figure 26. Timing for Changing XFx From Output to Input Mode

changing XFx from an input to an output

The following table defines the timing parameter for changing the XFx pin from an input pin to an output pin.

switching characteristics over recommended operating conditions for changing XFx from input to output mode (see Figure 27)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{d(H3H-XF)}$	Delay time, H3 high to XFx switching from input to output		4		3	ns



NOTE A: $\overline{I}$/OxFx represents either bit 1 or bit 5 of the IOF register.

Figure 27. Timing for Changing XFx From Input to Output Mode

reset timing

$\overline{\text{RESET}}$ is an asynchronous input that can be asserted at any time during a clock cycle. If the specified timings are met, the exact sequence shown in Figure 28 occurs; otherwise, an additional delay of one clock cycle is possible.

The asynchronous reset signals include XF0/1, CLKX0, DX0, FSX0, CLKR0, DR0, FSR0, and TCLK0/1.

Resetting the device initializes the bus control register to seven software wait states and therefore results in slow external accesses until these registers are initialized.

$\overline{\text{HOLD}}$ is a synchronous input that can be asserted during reset. It can take nine CPU cycles before $\overline{\text{HOLDA}}$ is granted.

The following tables define the timing parameters for the $\overline{\text{RESET}}$ signal.

timing requirements for $\overline{\text{RESET}}$ (see Figure 28)

		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(RESET-EXTCLKL)}$	Setup time, $\overline{\text{RESET}}$ before EXTCLK low	6	P−7†	5	P−7	ns
$t_{su(RESETH-H1L)}$	Setup time, $\overline{\text{RESET}}$ high before H1 low and after ten H1 clock cycles	6		5		ns

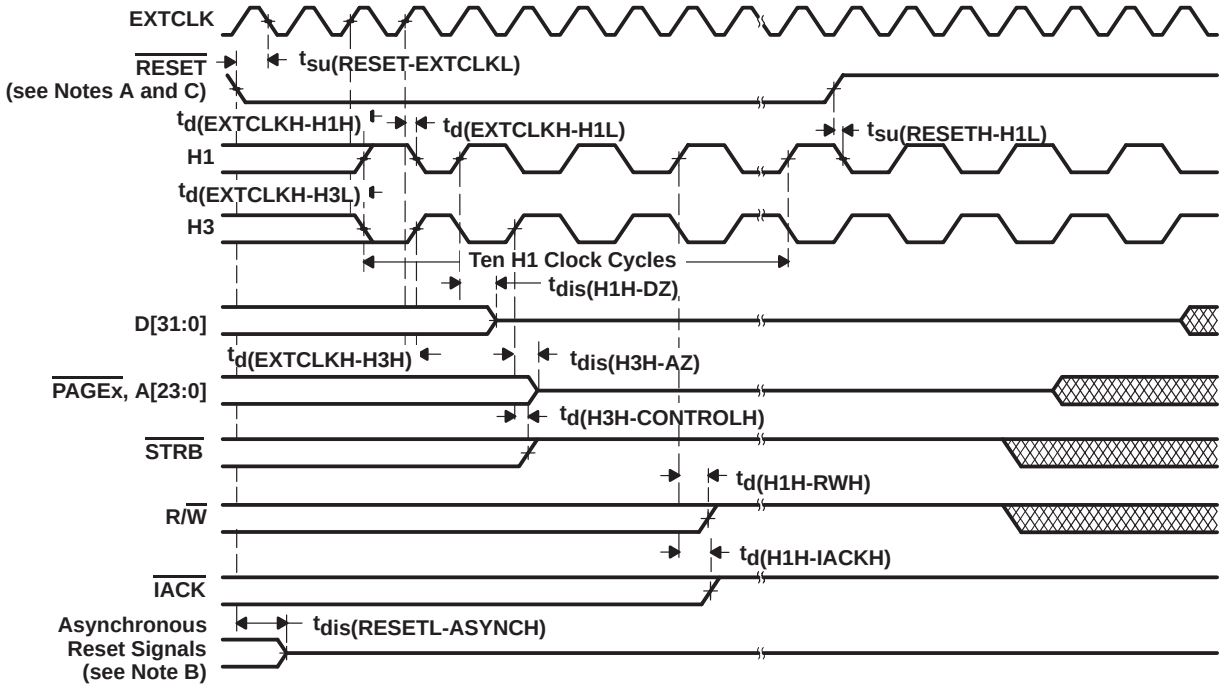
† $P = t_{c(EXTCLK)}$

switching characteristics over recommended operating conditions for $\overline{\text{RESET}}$ (see Figure 28)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{d(EXTCLKH-H1H)}$	Delay time, EXTCLK high to H1 high	2	7	2	7	ns
$t_{d(EXTCLKH-H1L)}$	Delay time, EXTCLK high to H1 low	2	7	2	7	ns
$t_{d(EXTCLKH-H3L)}$	Delay time, EXTCLK high to H3 low	2	7	2	7	ns
$t_{d(EXTCLKH-H3H)}$	Delay time, EXTCLK high to H3 high	2	7	2	7	ns
$t_{dis(H1H-DZ)}$	Disable time, data (high impedance) from H1 high‡		7		6	ns
$t_{dis(H3H-AZ)}$	Disable time, address (high impedance) from H3 high		7		6	ns
$t_{d(H3H-CONTROLH)}$	Delay time, H3 high to control signals high		4		3	ns
$t_{d(H1H-RWH)}$	Delay time, H1 high to R/$\overline{\text{W}}$ high		4		3	ns
$t_{d(H1H-IACKH)}$	Delay time, H1 high to $\overline{\text{IACK}}$ high		4		3	ns
$t_{dis(RESETL-ASYNCH)}$	Disable time, asynchronous reset signals disabled (high impedance) from $\overline{\text{RESET}}$ low§		7		6	ns

‡ High impedance for Dbus is limited to nominal bus keeper Z_{OUT} = 15 kΩ.
§ Asynchronous reset signals include XF0/1, CLKX0, DX0, FSX0, CLKR0, DR0, FSR0, and TCLK0/1.

reset timing (continued)



NOTES: A. Clock circuit is configured in ’C31-compatible divide-by-2 mode. If configured for x1 mode, EXTCLK directly drives H3.
B. Asynchronous reset signals include XF0/1, CLKX0, DX0, FSX0, CLKR0, DR0, FSR0, and TCLK0/1.
C. RESET is a synchronous input that can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle is possible.
D. In microprocessor mode, the reset vector is fetched twice, with seven software wait states each time. In microcomputer mode, the reset vector is fetched twice, with no software wait states.
E. The address and PAGE3-PAGE0 outputs are placed in a high-impedance state during reset requiring a nominal 10−22 kΩ pullup. If not, undesirable spurious reads can occur when these outputs are not driven.

Figure 28. RESET Timing

interrupt response timing

The following table defines the timing parameters for the $\overline{\text{INTx}}$ signals.

timing requirements for $\overline{\text{INT3}}$–$\overline{\text{INT0}}$ response (see Figure 29)

		VC33-120			VC33-150			UNIT
		MIN	NOM	MAX	MIN	NOM	MAX	
$t_{su(INT-H1L)}$	Setup time, $\overline{\text{INT3}}$– $\overline{\text{INT0}}$ before H1 low	5			4			ns
$t_{h(H1L-INT)}$	Hold time, $\overline{\text{INT3}}$– $\overline{\text{INT0}}$ after H1 low			0			0	ns
$t_{w(INT)}$	Pulse duration, interrupt to ensure only one interrupt	P+5†	1.5P	2P–5†	P+5†	1.5P	2P–5†	ns

† $P = t_{c(H)}$

The interrupt ($\overline{\text{INTx}}$) pins are synchronized inputs that can be asserted at any time during a clock cycle. The TMS320C3x interrupts are selectable as level- or edge-sensitive. Interrupts are detected on the falling edge of H1. Therefore, interrupts must be set up and held to the falling edge of the internal H1 for proper detection. The CPU and DMA respond to detected interrupts on instruction-fetch boundaries only.

For the processor to recognize only one interrupt when level mode is selected, an interrupt pulse must be set up and held such that a logic-low condition occurs for:

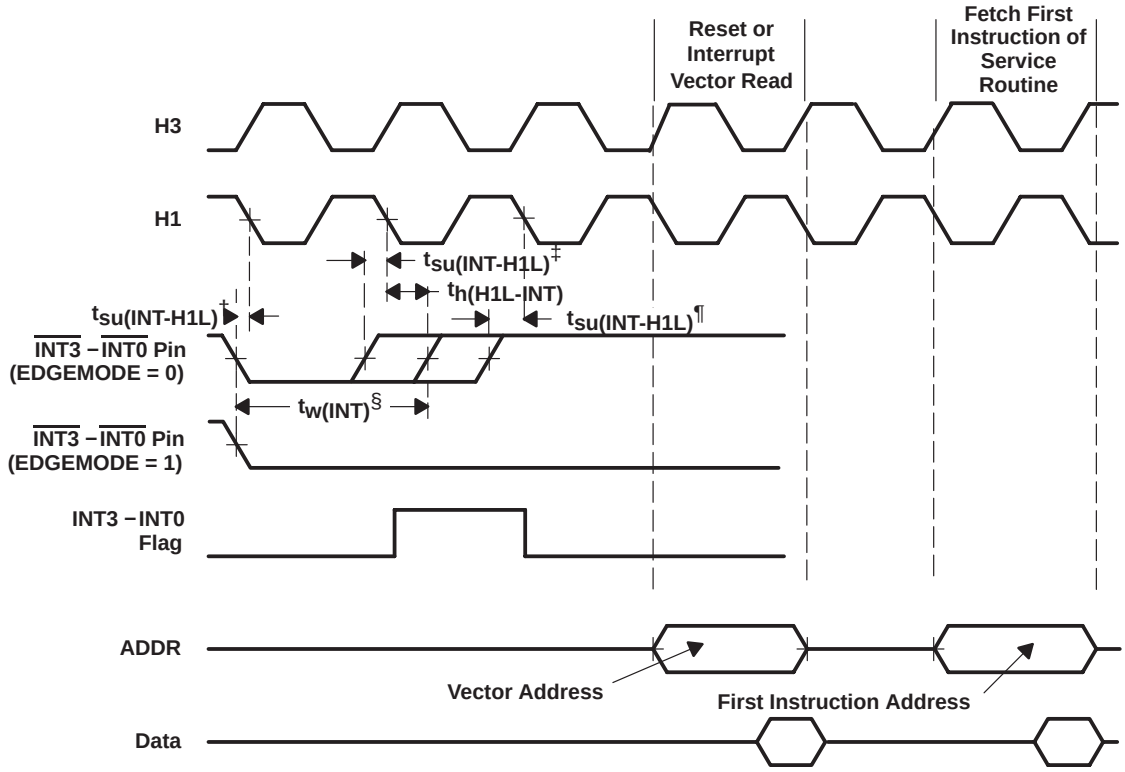
- A minimum of one H1 falling edge
- No more than two H1 falling edges
- Interrupt sources whose edges cannot be ensured to meet the H1 falling edge setup and hold times must be further restricted in pulse width as defined by $t_{w(INT)}$ (parameter 51) in the table above.

When EDGEMODE=1, the falling edge of the $\overline{\text{INT0}}$–$\overline{\text{INT3}}$ pins are detected using synchronous logic (see Figure 7). The pulse low and high time should be two CPU clocks or greater.

The TMS320C3x can set the interrupt flag from the same source as quickly as two H1 clock cycles after it has been cleared.

If the specified timings are met, the exact sequence shown in Figure 29 occurs; otherwise, an additional delay of one clock cycle is possible.

interrupt response timing (continued)



† Falling edge of H1 just detects $\overline{\text{INTx}}$ falling edge.
‡ Falling edge of H1 detects second $\overline{\text{INTx}}$ low, however flag clear takes precedence.
§ Nominal width
¶ Falling edge of H1 misses previous $\overline{\text{INTx}}$ low as $\overline{\text{INTx}}$ rises.

Figure 29. $\overline{\text{INT3}}$−$\overline{\text{INT0}}$ Response Timing

interrupt-acknowledge timing

The $\overline{\text{IACK}}$ output goes active on the first half-cycle (HI rising) of the decode phase of the IACK instruction and goes inactive at the first half-cycle (HI rising) of the read phase of the IACK instruction.

The following table defines the timing parameters for the $\overline{\text{IACK}}$ signal.

NOTE: The IACK instruction can be executed at anytime to signal an event using the $\overline{\text{IACK}}$ pin. The IACK instruction is most often used within an interrupt routine to signal which interrupt has occurred. The IACK instruction must be executed to generate the $\overline{\text{IACK}}$ pulse.

switching characteristics over recommended operating conditions for $\overline{\text{IACK}}$ (see Figure 30)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{d(H1H-IACKL)}$	Delay time, H1 high to $\overline{\text{IACK}}$ low	−1	4	−1	3	ns
$t_{d(H1H-IACKH)}$	Delay time, H1 high to $\overline{\text{IACK}}$ high	−1	4	−1	3	ns

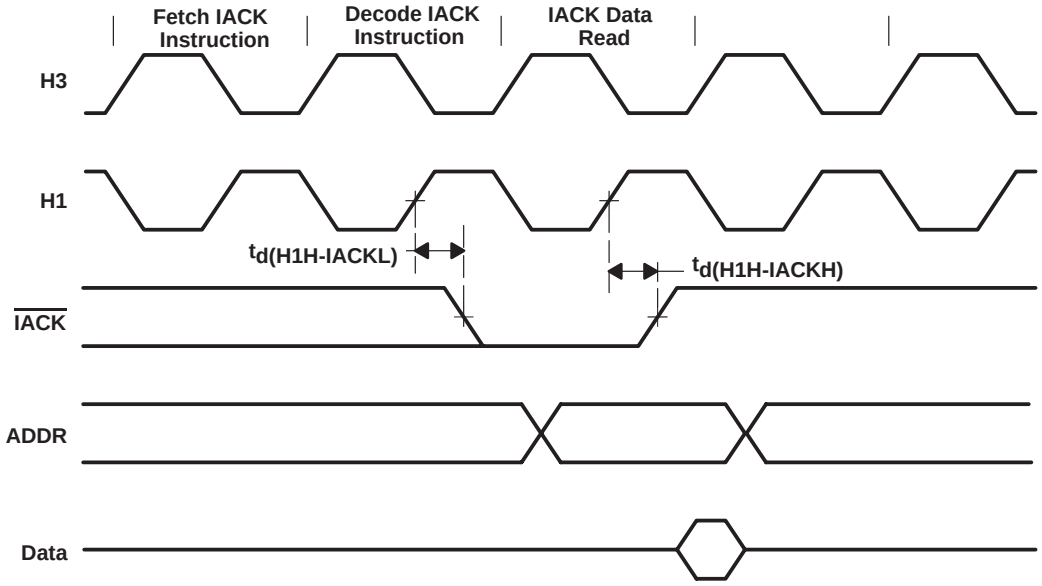


Figure 30. Interrupt Acknowledge ($\overline{\text{IACK}}$) Timing

serial-port timing parameters

The following tables define the timing parameters for the serial port.

timing requirements (see Figure 31 and Figure 32)

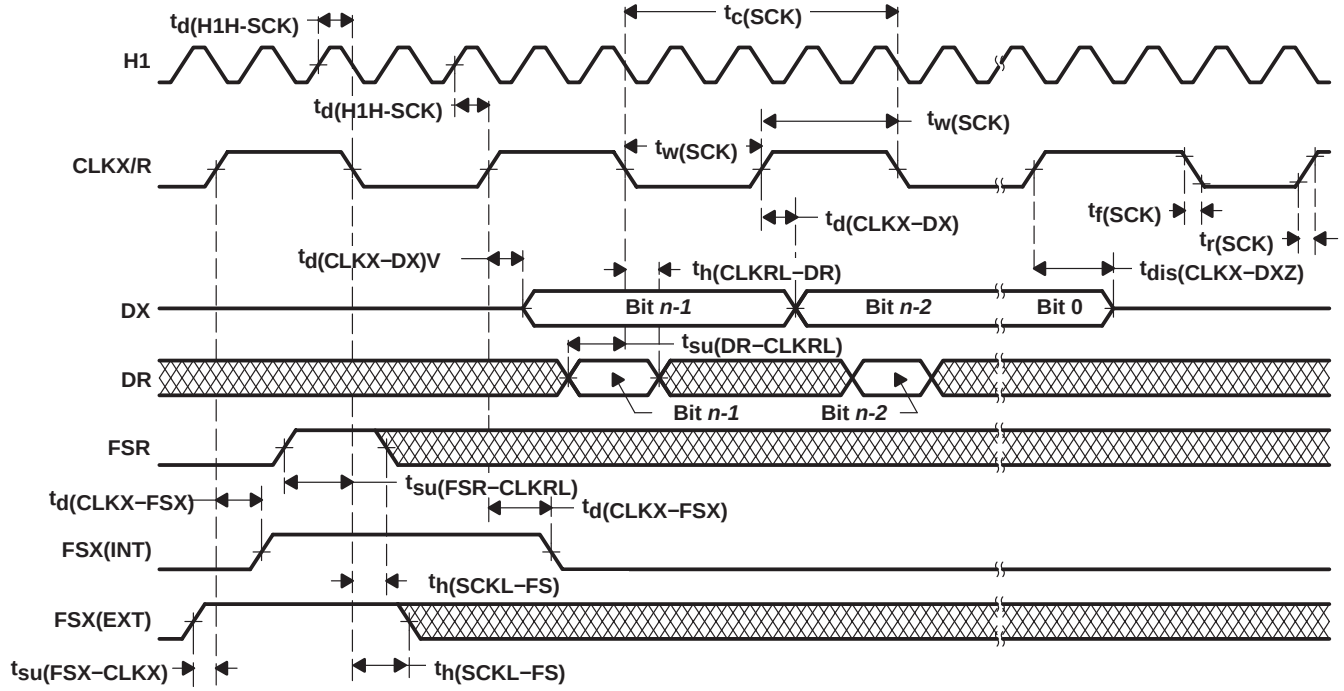
			MIN	MAX	UNIT
$t_{c(SCK)}$	Cycle time, CLKX/R	CLKX/R ext	$t_{c(H)} * 2.6$		ns
		CLKX/R int	$t_{c(H)} * 2$	$t_{c(H)} * 2^{16}$	
$t_{w(SCK)}$	Pulse duration, CLKX/R high/low	CLKX/R ext	$t_{c(H)} + 5$		ns
		CLKX/R int	$[t_{c(SCK)}/2] - 4$	$[t_{c(SCK)}/2] + 4$	
$t_{r(SCK)}$	Rise time, CLKX/R			3	ns
$t_{f(SCK)}$	Fall time, CLKX/R			3	ns
$t_{su(DR-CLKRL)}$	Setup time, DR before CLKR low	CLKR ext	4		ns
		CLKR int	5		
$t_{h(CLKRL-DR)}$	Hold time, DR after CLKR low	CLKR ext	3		ns
		CLKR int	0		
$t_{su(FSR-CLKRL)}$	Setup time, FSR before CLKR low	CLKR ext	4		ns
		CLKR int	5		
$t_{h(SCKL-FS)}$	Hold time, FSX/R input after CLKX/R low	CLKX/R ext	3		ns
		CLKX/R int	0		
$t_{su(FSX-CLKX)}$	Setup time, external FSX before CLKX	CLKX ext	$-[t_{c(H)} - 6]$	$[t_{c(SCK)}/2] - 6$	ns
		CLKX int	$-[t_{c(H)} - 10]$	$t_{c(SCK)}/2$	

switching characteristics over recommended operating conditions (see Figure 31 and Figure 32)

PARAMETER			MIN	MAX	UNIT
$t_{d(H1H-SCK)}$	Delay time, H1 high to internal CLKX/R			4	ns
$t_{d(CLKX-DX)}$	Delay time, CLKX to DX valid	CLKX ext		6	ns
		CLKX int		5	
$t_{d(CLKX-FSX)}$	Delay time, CLKX to internal FSX high/low	CLKX ext		5	ns
		CLKX int		4	
$t_{d(CLKX-DX)V}$	Delay time, CLKX to first DX bit, FSX precedes CLKX high	CLKX ext		5	ns
		CLKX int		4	
$t_{d(FSX-DX)V}$	Delay time, FSX to first DX bit, CLKX precedes FSX			6	ns
$t_{dis(CLKX-DXZ)}$	Disable time, DX high impedance following last data bit from CLKX high			6	ns

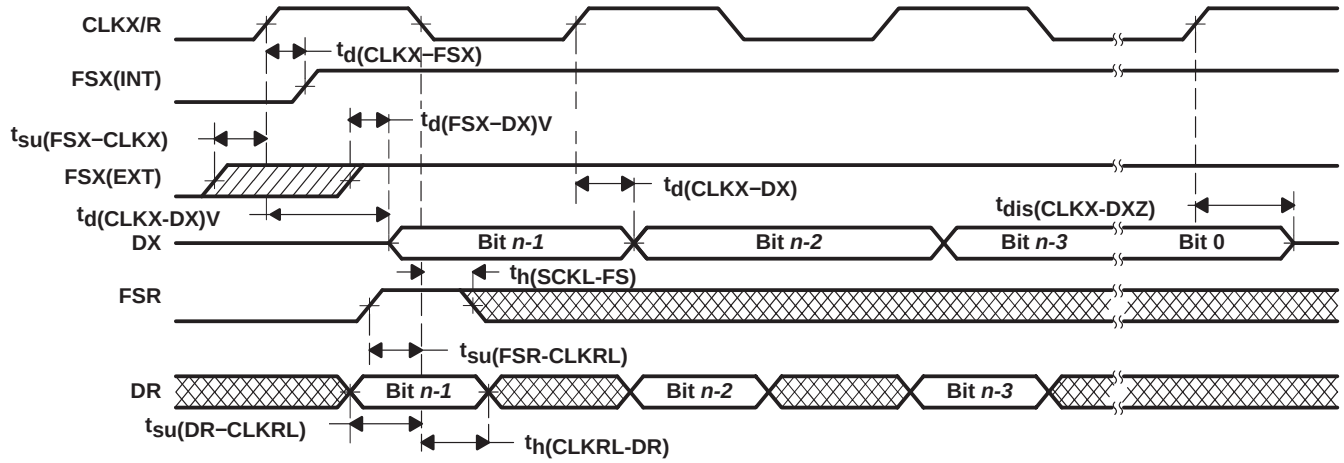
data-rate timing modes

Unless otherwise indicated, the data-rate timings shown in Figure 31 and Figure 32 are valid for all serial-port modes, including handshake. For a functional description of serial-port operation, see the *TMS320C3x User's Guide* (literature number SPRU031).



NOTES: A. Timing diagrams show operations with CLKXP = CLKRP = FSXP = FSRP = 0.
B. Timing diagrams depend on the length of the serial-port word, where n = 8, 16, 24, or 32 bits, respectively.

Figure 31. Fixed Data-Rate Mode Timing



NOTES: A. Timing diagrams show operation with CLKXP = CLKRP = FSXP = FSRP = 0.
B. Timing diagrams depend on the length of the serial-port word, where n = 8, 16, 24, or 32 bits, respectively.
C. The timings that are not specified expressly for the variable data-rate mode are the same as those that are specified for the fixed data-rate mode.

Figure 32. Variable Data-Rate Mode Timing

$\overline{\text{HOLD}}$ timing

$\overline{\text{HOLD}}$ is a synchronous input that can be asserted at any time during a clock cycle. If the specified timings are met, the exact sequence shown in Figure 33 and Figure 34 occurs; otherwise, an additional delay of one clock cycle is possible.

The table, “timing parameters for $\overline{\text{HOLD}}$/$\overline{\text{HOLDA}}$”, defines the timing parameters for the $\overline{\text{HOLD}}$ and $\overline{\text{HOLDA}}$ signals. The NOHOLD bit of the primary-bus control register overrides the $\overline{\text{HOLD}}$ signal. When this bit is set, the device comes out of hold and prevents future hold cycles.

Asserting $\overline{\text{HOLD}}$ prevents the processor from accessing the primary bus. Program execution continues until a read from or a write to the primary bus is requested. In certain circumstances, the first write is pending, therefore, allowing the processor to continue (internally) until a second external write is encountered.

Figure 33, Figure 34, and the accompanying timings are for a zero wait-state bus configuration. Since $\overline{\text{HOLD}}$ is internally captured by the CPU on the H1 falling edge one cycle before the present cycle is terminated, the minimum $\overline{\text{HOLD}}$ width for any bus configuration is, therefore, WTCNT+3. Also, $\overline{\text{HOLD}}$ should not be deasserted before $\overline{\text{HOLDA}}$ has been active for at least one cycle.

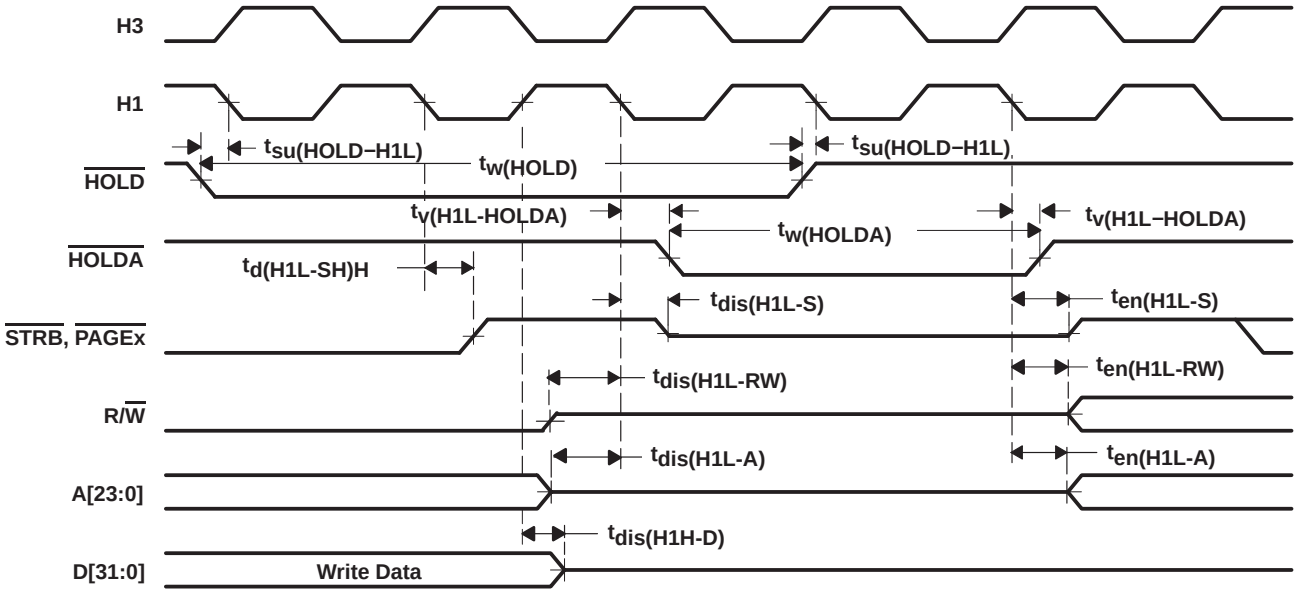
timing requirements for $\overline{\text{HOLD}}$/$\overline{\text{HOLDA}}$ (see Figure 33 and Figure 34)

		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(HOLD-H1L)}$	Setup time, $\overline{\text{HOLD}}$ before H1 low	4		3		ns
$t_{w(HOLD)}$	Pulse duration, $\overline{\text{HOLD}}$ low	$3t_{c(H)}$		$3t_{c(H)}$		ns

switching characteristics over recommended operating conditions for $\overline{\text{HOLD}}$/$\overline{\text{HOLDA}}$ (see Figure 33 and Figure 34)

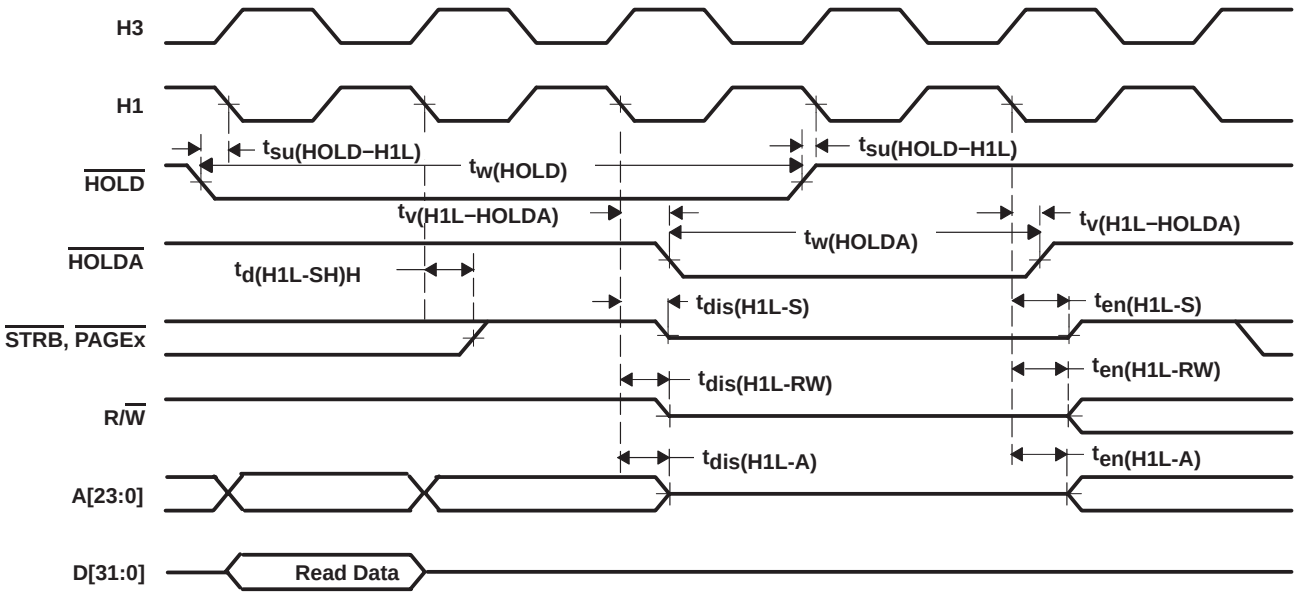
PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{v(H1L-HOLDA)}$	Valid time, $\overline{\text{HOLDA}}$ after H1 low	−1	4	−1	3	ns
$t_{w(HOLDA)}$	Pulse duration, $\overline{\text{HOLDA}}$ low	$2t_{c(H)} - 4$		$2t_{c(H)} - 4$		ns
$t_{d(H1L-SH)H}$	Delay time, H1 low to $\overline{\text{STRB}}$ high for a $\overline{\text{HOLD}}$	−1	4	−1	3	ns
$t_{dis(H1L-S)}$	Disable time, $\overline{\text{STRB}}$ to the high-impedance state from H1 low		5		4	ns
$t_{en(H1L-S)}$	Enable time, $\overline{\text{STRB}}$ enabled (active) from H1 low		5		5	ns
$t_{dis(H1L-RW)}$	Disable time, R/$\overline{\text{W}}$ to the high-impedance state from H1 low		5		4	ns
$t_{en(H1L-RW)}$	Enable time, R/$\overline{\text{W}}$ enabled (active) from H1 low		5		5	ns
$t_{dis(H1L-A)}$	Disable time, Address to the high-impedance state from H1 low		5		4	ns
$t_{en(H1L-A)}$	Enable time, Address enabled (valid) from H1 low		5		5	ns
$t_{dis(H1H-D)}$	Disable time, Data to the high-impedance state from H1 high		5		4	ns

$\overline{\text{HOLD}}$ timing (continued)



NOTE A: $\overline{\text{HOLDA}}$ goes low in response to $\overline{\text{HOLD}}$ going low and continues to remain low until one H1 cycle after $\overline{\text{HOLD}}$ goes back high.

Figure 33. Timing for $\overline{\text{HOLD}}$/$\overline{\text{HOLDA}}$ (After Write)



NOTE A: $\overline{\text{HOLDA}}$ goes low in response to $\overline{\text{HOLD}}$ going low and continues to remain low until one H1 cycle after $\overline{\text{HOLD}}$ goes back high.

Figure 34. Timing for $\overline{\text{HOLD}}$/$\overline{\text{HOLDA}}$ (After Read)

general-purpose I/O timing

Peripheral pins include CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, and TCLK0/1. The contents of the internal control registers associated with each peripheral define the modes for these pins.

peripheral pin I/O timing

The following tables show the timing parameters for changing the peripheral pin from a general-purpose output pin to a general-purpose input pin and vice versa.

timing requirements for peripheral pin general-purpose I/O (see Note 1, Figure 35, and Figure 36)

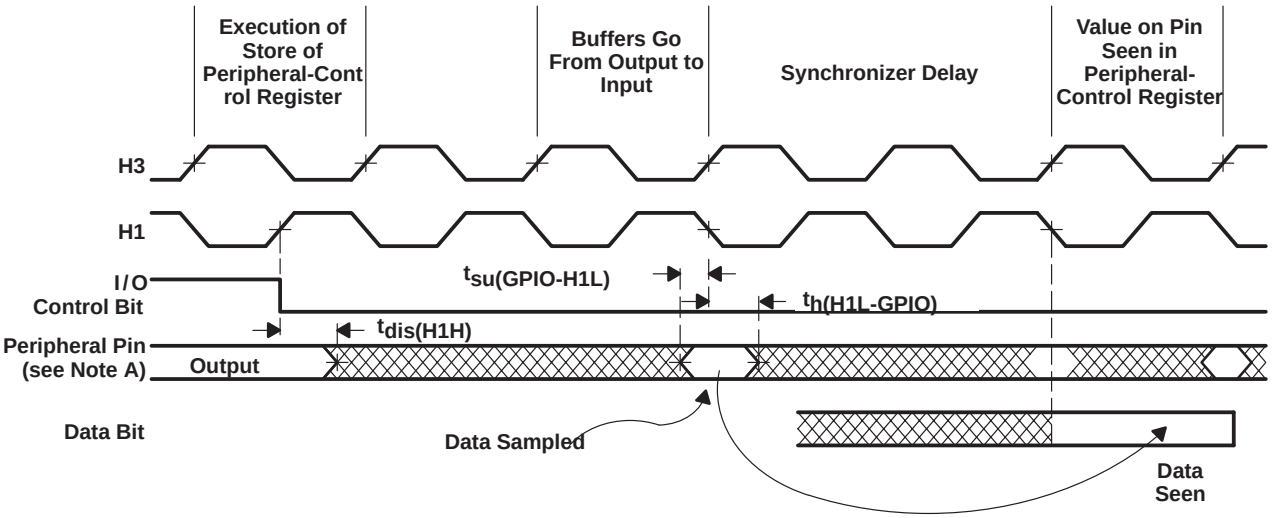
		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(GPIO-H1L)}$	Setup time, general-purpose input before H1 low	4		3		ns
$t_{h(H1L-GPIO)}$	Hold time, general-purpose input after H1 low	0		0		ns

NOTE 1: Peripheral pins include CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, and TCLK0/1. The modes of these pins are defined by the contents of internal-control registers associated with each peripheral.

switching characteristics over recommended operating conditions for peripheral pin general-purpose I/O (see Note 1, Figure 35, and Figure 36)

PARAMETER		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{d(H1H-GPIO)}$	Delay time, H1 high to general-purpose output		5		4	ns
$t_{dis(H1H)}$	Disable time, general-purpose output from H1 high		7		5	ns

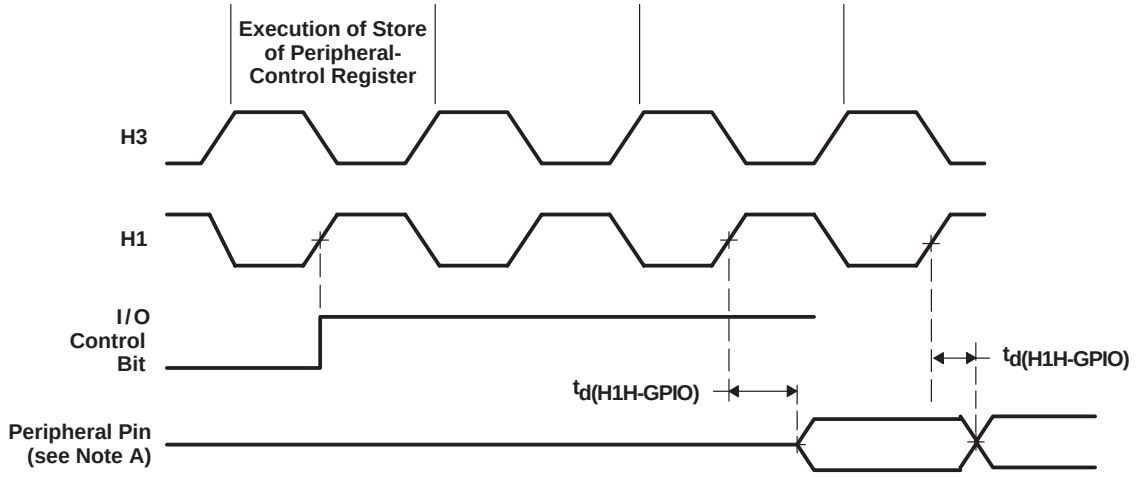
NOTE 1: Peripheral pins include CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, and TCLK0/1. The modes of these pins are defined by the contents of internal-control registers associated with each peripheral.



NOTE A: Peripheral pins include CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, and TCLK0/1.

Figure 35. Change of Peripheral Pin From General-Purpose Output to Input Mode Timing

peripheral pin I/O timing (continued)



NOTE A: Peripheral pins include CLKX0, CLKR0, DX0, DR0, FSX0, FSR0, and TCLK0/1.

Figure 36. Change of Peripheral Pin From General-Purpose Input to Output Mode Timing

timer pin timing

Valid logic-level periods and polarity are specified by the contents of the internal control registers. The following tables define the timing parameters for the timer pin.

timing requirements for timer pin (see Figure 37 and Figure 38)

		VC33-120		VC33-150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(TCLK-H1L)}$†	Setup time, TCLK external before H1 low	4		3		ns
$t_{h(H1L-TCLK)}$†	Hold time, TCLK external after H1 low	0		0		ns

† These requirements are applicable for a synchronous input clock.

switching characteristics over recommended operating conditions for timer pin (see Figure 37 and Figure 38)

PARAMETER			VC33-120		VC33-150		UNIT
			MIN	MAX	MIN	MAX	
$t_{d(H1H-TCLK)}$	Delay time, H1 high to TCLK internal valid			4		3	ns
$t_{c(TCLK)}$‡	Cycle time, TCLK	TCLK ext	$t_{c(H)}$ * 2.6		$t_{c(H)}$ * 2.6		ns
		TCLK int	$t_{c(H)}$ * 2	$t_{c(H)}$ * 2^{32}	$t_{c(H)}$ * 2	$t_{c(H)}$ * 2^{32}	
$t_{w(TCLK)}$‡	Pulse duration, TCLK	TCLK ext	$t_{c(H)}$ + 6		$t_{c(H)}$ + 5		ns
		TCLK int	$[t_{c(TCLK)}/2] - 4$	$[t_{c(TCLK)}/2] + 4$	$[t_{c(TCLK)}/2] - 4$	$[t_{c(TCLK)}/2] + 4$	

‡ These parameters are applicable for an asynchronous input clock.

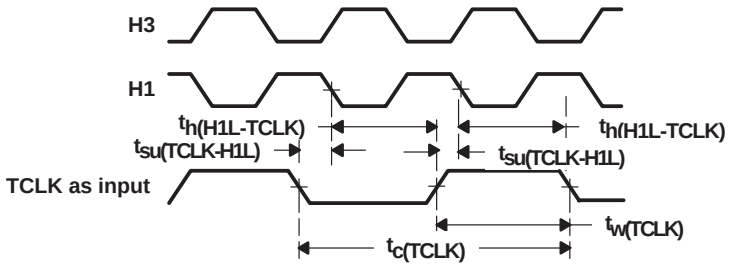


Figure 37. Timer Pin Timing, Input

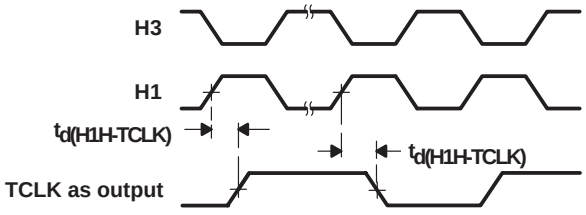

Figure 38. Timer Pin Timing, Output

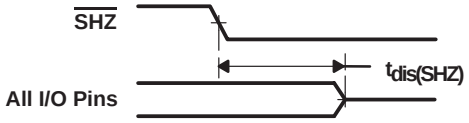
$\overline{\text{SHZ}}$ pin timing

The following table defines the timing parameter for the $\overline{\text{SHZ}}$ pin.

switching characteristics over recommended operating conditions for $\overline{\text{SHZ}}$ (see Figure 39)

	PARAMETER	MIN	MAX	UNIT
$t_{dis(SHZ)}$	Disable time, $\overline{\text{SHZ}}$ low to all outputs, I/O pins disabled (high impedance)	0	8	ns



NOTE A: Enabling $\overline{\text{SHZ}}$ destroys TMS320VC33 register and memory contents. Assert $\overline{\text{SHZ}}$ = 1 and reset the TMS320VC33 to restore it to a known condition.

Figure 39. Timing for $\overline{\text{SHZ}}$

IEEE-1149.1 test access port timing

The following table defines the timing parameter for the IEEE-1149.1 test access port.

timing for IEEE-1149.1 test access port (see Figure 40)

		VC33−120		VC33−150		UNIT
		MIN	MAX	MIN	MAX	
$t_{su(TMS-TCKH)}$	Setup time, TMS/TDI to TCK high	5		5		ns
$t_{h(TCKH-TMS)}$	Hold time, TMS/TDI from TCK high	5		5		ns
$t_{d(TCKL-TDOV)}$	Delay time, TCK low to TDO valid	0	10	0	10	ns
$t_{r(TCK)}$	Rise time, TCK		3		3	ns
$t_{f(TCK)}$	Fall time, TCK		3		3	ns

$R_{\Theta JC}$	5

PACKAGING INFORMATION

Orderable Device	Status [1]	Package Type	Package Drawing	Pins	Package Qty	Eco Plan [2]	Lead/Ball Finish	MSL Peak Temp [3]
TMS320VC33PGE120	ACTIVE	LQFP	PGE	144	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
TMS320VC33PGE120G4	ACTIVE	LQFP	PGE	144	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
TMS320VC33PGE150	ACTIVE	LQFP	PGE	144	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
TMS320VC33PGEA120	ACTIVE	LQFP	PGE	144	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
